A document (max 10 pages/slides) describing what the project does and including relevant screenshots of the website (the document can consist of a number of screenshots and a brief paragraph for each screenshot); The document should also describe what to do in order to make it work on a different environment (e.g., set the base tag, change configuration settings);
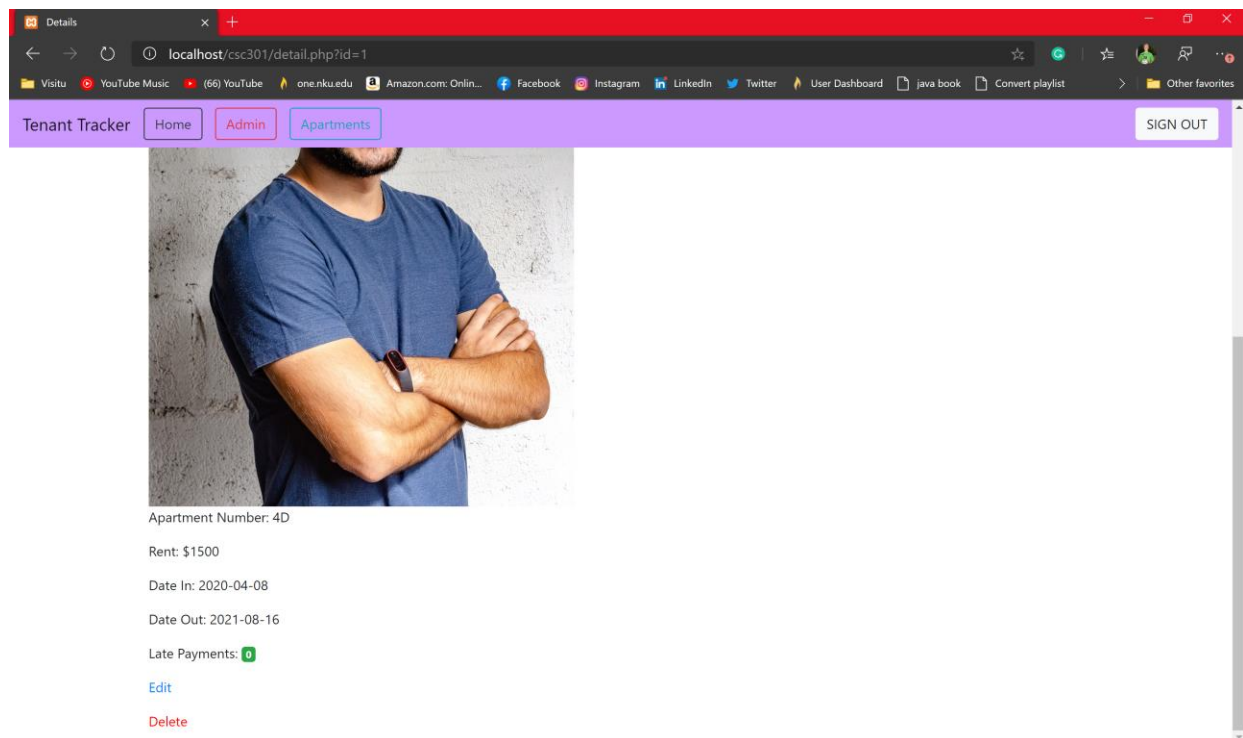

My project manages tenants for leasing companies.

The site requires you to be logged in in order to do anything. If you do not have an account you can sign up. Admins must have an email of admin@[some site].
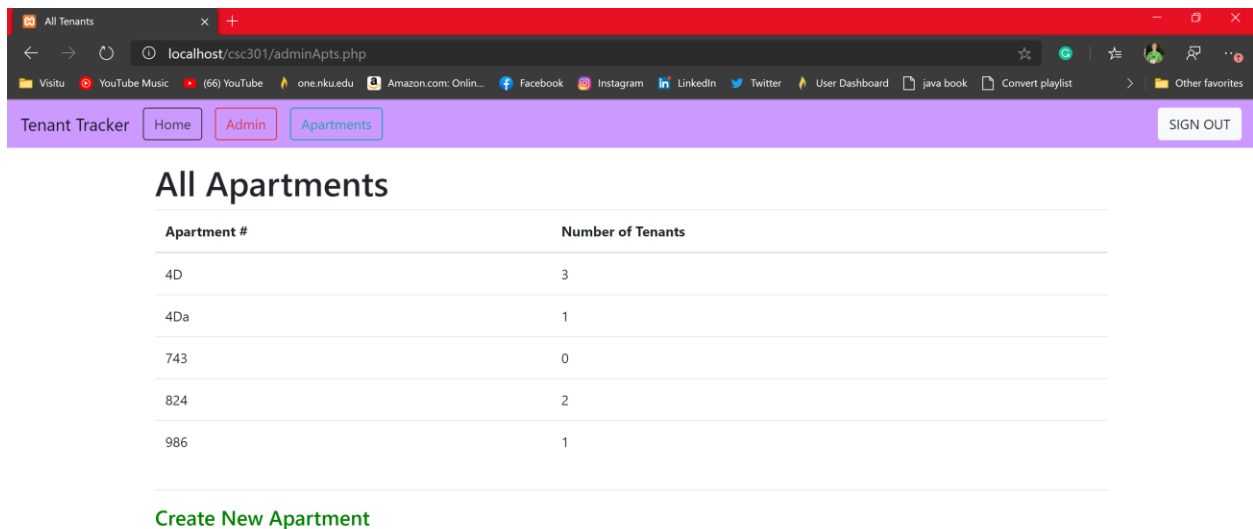

The index page gives a view of all tenants. You can click to see more details or click the create new button at the bottom to create a new tenant.

The detail view gives more detail on the tenant as well as options to edit or delete them. Managers and Admins can edit and delete any tenant, while normal users can only manage tenants they created.

The Admin page shows all user accounts and allows the admin to create, edit, and delete accounts. It can only be viewed by Admins.

The Apartments page can also only be viewed by admins and allows them to see the number of tenants in each apartment as well as create new apartments.

In order to set up the database, you can use the sql dump provided. The Admin and manager roles must be set up using the sql database. The create() functions can also be edited within any *DB.php.
